

8011 Feed Monitoring System

8011 Feed Monitor

The 8011 can monitor up to 10 separate silos. It will display the weight in each silo and will monitor total deliveries, last delivery, last 24 hours feed used and total feed used for each silo.

The 8011 can be programmed with the farm name and address, time and date. High and low alarm limits can be set to allow the user to make sure the amount of feed required in each silo is correct and if the feed level drops below the set limit it can either set off an alarm or send an email to the office or mill.

Data is stored within the 8011 and can either be downloaded direct to a PC, separate printer or sent to an email address, the 8011 System takes the guess work out of all the feed inventory, deliveries can be programmed and running out of feed a thing of the past.

8006 Control Feeding System

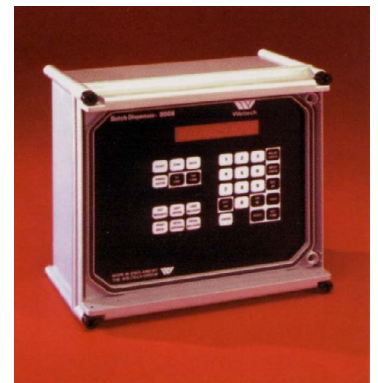

The 8006 is capable of batching direct from a single silo up to 6 separate feeds of differing amounts. Using the key panel the actual time can be set along with the number of feeds to be dispensed and at what time the feeding is to take place.

Motorized valves are fitted to the auger above each hopper the feed is to be dispensed into and when programmed the 8006 will dispense the set amounts of feed into each hopper, the system is ideal for scatter feeding systems.

Last delivery, total deliveries, last amount of feed per batch and total feed batched are all stored in the 8006.

The Weltech 8006 feeding system provides all that is needed for today's modern farm.

All the controllers are housed in a glass filled polyester case or hard plastic case which are water and dust retardant
